(57) **ABSTRACT**

A fixturing apparatus that includes a base, a housing attached
to the base and formed to include a semi-circular arcuate
surface in a bottom portion, a circular member comprising a
periphery and rotatably attached to said base, wherein a por-
tion of said periphery is disposed adjacent the arcuate surface
to create a channel between the housing and the circular
member, a plurality of locking teeth disposed around the
periphery, a ratchet gear attached to the circular member, and
a pawl pivotably attached to the housing.

FIXTURING APPARATUS**CROSS-REFERENCE TO RELATED APPLICATIONS**

This Application is a Divisional of U.S. application having Ser. No. 12/741,821, filed on Sep. 30, 2010, which is incorporated herein by reference and which claimed priority from an International Patent Application having a PCT Application No. PCT/US08/82685 filed on Nov. 6, 2008, which is incorporated herein by reference and which claimed priority from a U.S. Provisional Patent Application having Ser. No. 60/985,881 filed Nov. 6, 2007 which is hereby incorporated herein by reference.

FIELD OF THE INVENTION

This invention relates to a fixturing apparatus and to a method to form that fixturing apparatus. In certain embodiments, the invention relates to a fixturing apparatus for cables.

BACKGROUND OF THE INVENTION

It is known in the art to releaseably attached a first surface to a second surface by disposing a plurality of flexible loop-type fasteners on one of the surfaces and a plurality of flexible hook-type fasteners on the other surface. When mated, the plurality of flexible hook-type fasteners engage with the plurality of flexible loop-type fasteners to releaseably secure the first surface to the second surface.

BRIEF DESCRIPTION OF THE DRAWINGS

The invention will be better understood from a reading of the following detailed description taken in conjunction with the drawings in which like reference designators are used to designate like elements, and in which:

FIG. 1 illustrates a first embodiment of Applicant's fixturing apparatus **100**;

FIG. 2 illustrates a second embodiment of Applicant's fixturing apparatus **100**;

FIG. 3A illustrates the fixturing apparatus of FIG. 2 in combination with flexible strap **310**;

FIG. 3B illustrates the fixturing apparatus of FIG. 3A wherein flexible strap **310** encircles a bundle of cables;

FIG. 3C is a cross-sectional view of the fixturing apparatus of FIG. 1;

FIG. 3D shows a first embodiment of Applicant's rigid locking tooth;

FIG. 3E shows a second embodiment of Applicant's rigid locking tooth;

FIG. 3F shows a third embodiment of Applicant's rigid locking tooth;

FIG. 3G shows a second perspective view of the rigid locking tooth of FIG. 3F;

FIG. 3H shows a fourth embodiment of Applicant's rigid locking tooth;

FIG. 4A is a perspective view of a plurality of Applicant's rigid locking teeth arranged in a first orientation;

FIG. 4B is a first top view of the plurality of Applicant's rigid locking teeth shown in FIG. 4A;

FIG. 4C is a second top view of the plurality of Applicant's rigid locking teeth shown in FIG. 4A;

FIG. 5A is a first top view of the plurality of Applicant's rigid locking teeth arranged in a second orientation;

FIG. 5B is a top view of four of Applicant's rigid locking teeth arranged in the orientation of FIG. 5A;

2

FIG. 5C shows the angle formed by the intersection of the long axes of two adjacent rigid locking teeth in the same column, wherein those rigid locking teeth are arranged in the orientation of FIG. 5A;

FIG. 5D is a second top view of the plurality of Applicant's rigid locking teeth shown in FIG. 5A;

FIG. 6A is a first top view of the plurality of Applicant's rigid locking teeth arranged in a third orientation;

FIG. 6B is a second top view of the plurality of rigid locking teeth shown in FIG. 6A;

FIG. 7A is a perspective view of Applicant's rigid locking teeth arranged in a fourth orientation;

FIG. 7B is a first top view of the plurality of Applicant's rigid locking teeth arranged in the orientation of FIG. 7A;

FIG. 7C is a second top view of the plurality of rigid locking teeth shown in FIG. 7A;

FIG. 8A is a first top view of the plurality of Applicant's rigid locking teeth arranged in a fifth orientation;

FIG. 8B is a second top view of the plurality of rigid locking teeth shown in FIG. 8A;

FIG. 9A is a first top view of the plurality of Applicant's rigid locking teeth arranged in a sixth orientation; and

FIG. 9B is a second top view of the plurality of rigid locking teeth shown in FIG. 9A.

DETAILED DESCRIPTION OF PREFERRED EMBODIMENTS

This invention is described in preferred embodiments in the following description with reference to the Figures, in which like numbers represent the same or similar elements. Reference throughout this specification to "one embodiment," "an embodiment," or similar language means that a particular feature, structure, or characteristic described in connection with the embodiment is included in at least one embodiment of the present invention. Thus, appearances of the phrases "in one embodiment," "in an embodiment," and similar language throughout this specification may, but do not necessarily, all refer to the same embodiment.

The described features, structures, or characteristics of the invention may be combined in any suitable manner in one or more embodiments. In the following description, numerous specific details are recited to provide a thorough understanding of embodiments of the invention. One skilled in the relevant art will recognize, however, that the invention may be practiced without one or more of the specific details, or with other methods, components, materials, and so forth. In other instances, well-known structures, materials, or operations are not shown or described in detail to avoid obscuring aspects of the invention.

A ratchet is a mechanical device that allows continuous rotary motion in only one direction while preventing motion in the opposite direction. A ratchet consists of a circular gear, and a pivoting, spring-loaded finger called a pawl that engages the teeth. The teeth are uniform but asymmetrical.

When the teeth are moving in the unrestricted, i.e., forward, direction the pawl slides up and over sloped edges of the teeth, optionally with a spring forcing it into a depression between the teeth as it passes the tip of each tooth. When the teeth move in the opposite (backward) direction, however, the pawl will catch against the steeply sloped edge of the first tooth it encounters, thereby locking it against the tooth and preventing any further motion in that direction.

Referring to FIG. 1, Applicant's fixturing apparatus **100** comprises a circular member **110** rotatably mounted on base **105**, a ratchet gear **120** mounted on the rotatable circular member **110**, and a pawl **130** pivotably mounted on housing

3

102. In the illustrated embodiment of FIG. 1, pawl 130 is shown in a first orientation wherein that pawl 130 is not engaged with ratchet gear 120.

Circular member 110 comprises a periphery 112 defining the circumference thereof. A plurality 104 of Applicant's locking teeth are disposed around periphery 112 of rotatable circular member 110.

In certain embodiments, Applicant's plurality of rigid locking teeth 104 are formed from one or more metals. In certain embodiments, Applicant's plurality of rigid locking teeth are formed from one or more ceramic materials. In certain embodiments, Applicant's plurality of rigid locking teeth are formed from a polymeric material selected from a group consisting of nylon, polyamide, polyimide, polyamideimide, polyurethane, polyethylene, polypropylene, polycarbonate, polystyrene, and combinations thereof.

In the illustrated embodiment of FIG. 1, housing 102 is formed to include a semi-circular, arcuate surface 107 in a bottom portion thereof. Housing 102 is positioned relative to circular member 110 such that a portion of periphery 112 is disposed adjacent the entirety of arcuate surface 107 to form a semi-circular channel 106.

In the illustrated embodiment of FIG. 2, pawl 130 is positioned in a second orientation such that pawl 130 engages ratchet gear 110. FIG. 2 shows an optional spring 210 pushing pawl 130 into the second orientation of FIG. 2.

FIG. 3A shows fixturing apparatus 100 further comprising a flexible strap 310. End 312 of flexible strap 310 is shown attached to one side of housing 102. A portion of flexible strap 310 is disposed around the top of circular member 110, where that portion of flexible strap 310 is in contact with a portion of the plurality of locking teeth 104.

FIG. 3C shows a first plurality of rigid locking teeth 220, 230, 240, and 250, disposed on periphery 112 of circular member 110. Locking teeth 220, 230, 240, and 250, comprise a portion of the plurality of locking teeth 104.

Rigid locking tooth 220 is formed to include a sloping side portion 222, and a gripping edge 224. Similarly, rigid locking teeth 230, 240, and 250, are formed to include sloping side portions 232, 242, and 252, respectively. Rigid locking teeth 220, 230, 240, and 250, are further formed to include gripping edges 224, 234, 244, and 254, respectively.

A fabric material, such as for example and without limitation flexible strap 310, will slide across rigid locking teeth 220, 230, 240, and 250, in the non-fixturing direction 380, wherein that fabric moves across the sloping side portion of a rigid locking tooth before contacting the gripping edge of that rigid locking tooth. A fabric material will not, however, slide across rigid locking teeth 220, 230, 240, and/or 250 in the opposite, or fixturing direction 390. Rather when a force is applied to the fabric along the fixturing direction 390, portions of the fabric will engage gripping edges 224, 234, 244, and 254, thereby preventing movement of the fabric along the fixturing direction.

In embodiments wherein the fabric material comprises a plurality of flexible loop-type fasteners disposed on a surface in contact with locking teeth gripping edges 224, 234, 244, and 254, the gripping edges engage those flexible loop-type fasteners thereby preventing movement of the fabric in the fixturing direction.

In certain embodiments, flexible strap 310 comprises a fabric. By "fabric," Applicant means a flexible material formed by weaving or felting or knitting or crocheting natural and/or synthetic fibers. In certain embodiments, strap 150 comprises a nylon fabric. In certain embodiments, strap 310 comprises a cotton or polyester fabric.

4

In certain embodiments, end 314 of flexible strap 310 can be inserted into first end 101 of channel 106, and moved in direction 380 through channel 106 and outwardly through second end 103 of channel 106. After insertion in and through aperture channel 106 in first direction 380, flexible strap 310 cannot be moved backwardly through channel 106 in second direction 390.

Applicant has found that fixturing is extremely strong when the strap 200 is confined to an enclosed channel, such as aperture 106, extending through fixturing apparatus 100.

Referring once again to FIGS. 3A, 3B, and 3C, pawl 130 when in the second orientation of FIG. 3A allows rotation of circular member in direction 320, but prevents rotation of circular member 110 in direction 330. The plurality of rigid teeth 104 disposed along periphery 112 of circular member 110 allows movement of flexible strap 310 in direction 380, but prevents movement of flexible strap 310 in direction 390.

FIG. 3B shows flexible strap 310 encircling a bundle of cables 370. End 314 of flexible strap 310 can be moved downwardly in direction 380 to more securely fixture the bundle of cables 370 to housing 102. As described immediately hereinabove, pawl 130 allows rotation of circular member in direction 320, but prevents rotation of circular member 110 in direction 330. The plurality of rigid teeth 104 disposed along periphery 112 of circular member 110 allows movement of flexible strap 310 in direction 380, but prevents movement of flexible strap 310 in direction 390.

In certain embodiments, one or more of Applicant's rigid locking teeth comprises a rectangular base, a first rectangular surface attached to a first end of said rectangular base and extending outwardly therefrom, and a second rectangular surface attached to an opposing end of said rectangular base and extending outwardly therefrom, wherein a first rectangular surface distal end is attached to a said second rectangular surface distal end to form a gripping edge. For example and referring now to FIG. 3D, in certain embodiments Applicant's fixturing apparatus comprises one or more locking teeth 300. Rigid locking tooth 300 comprises a first embodiment of a five-sided structure.

Referring now to FIG. 3E, in certain embodiments Applicant's fixturing apparatus comprises one or more locking teeth 302. Rigid locking tooth 302 comprises a second embodiment of a five-sided structure.

Rigid locking teeth 300 and 302 comprise a rectangular base 310, a first rectangular surface 320 attached to a first end 314 of rectangular base 310 and extending outwardly therefrom, a second rectangular surface 340 attached to a second end 318 of rectangular base 310 and extending outwardly therefrom, wherein a first rectangular surface distal end is attached to a said second rectangular surface distal end to form a gripping edge 324.

With respect to rigid locking tooth 300, the first rectangular surface 320 in combination with rectangular base 310 define an internal dihedral angle of about 90 degrees. With respect to rigid locking tooth 302, the first rectangular surface 320 in combination with rectangular base 310 define an internal dihedral angle Φ greater than 90 degrees. In certain embodiments, Φ is about 110 degrees. In certain embodiments, Φ is about 120 degrees.

Referring now to FIG. 3F, in certain embodiments Applicant's fixturing apparatus comprises one or more rigid locking teeth 304. Rigid locking tooth 304 comprises a first embodiment of a six-sided structure. Referring now to FIG. 31-1, in certain embodiments Applicant's fixturing apparatus comprises one or more locking teeth 306. Rigid locking tooth 306 comprises a second embodiment of a six-sided structure.

5

In certain embodiments, Applicant's fixturing apparatus comprises zero or more rigid locking teeth **300**, in combination with zero or more rigid locking teeth **302**, in combination with zero or more rigid locking teeth **304**, in combination with zero or more rigid locking teeth **306**.

FIG. 3F shows Applicant's rigid locking tooth **304**. The lengths, widths, heights, and axes, described with respect to rigid locking tooth **304** also apply to rigid locking teeth **300**, **302**, and **306**. Base **310** comprises a rectangular shape defined by sides **312**, **314**, **316**, and **318**. Base **310** comprises a length **372** and a width **382**. In certain embodiments, length **372** is between about 0.0002 mm and about 5.0 mm. In certain embodiments, width **382** is between about 0.0001 mm and about 2.5 mm.

Rectangular-shaped side **320**, defined by sides **314**, **322**, **324**, and **326**, is attached to edge **314** of base **310** and extends upwardly therefrom. In the illustrated embodiment of FIG. 3A, side **320** and base **310** intersect to form a dihedral angle of about ninety degrees (90°). Side **320** comprises a height **375** and width **382**.

In certain embodiments, height **375** is between about 0.0001 mm and about 5 mm. In certain embodiments, height **375** is about 0.0001 mm. In certain embodiments, height **375** is about 0.001 mm. In certain embodiments, height **375** is about 0.01 mm. In certain embodiments, height **375** is about 0.1 mm. In certain embodiments, height **375** is about 1 mm.

Rectangular-shaped side **330**, defined by sides **318**, **332**, **334**, and **336**, is attached edge **318** of base **310**, and extends upwardly therefrom. In the illustrated embodiment of FIG. 3F, side **330** and base **310** intersect to form a dihedral angle of about ninety degrees (90°). Side **330** comprises a height **385** and width **382**. In certain embodiments, height **385** is between about 0 mm and about 2.0 mm.

As those skilled in the art will appreciate, where height **385** is 0 mm, rigid locking tooth **304** becomes rigid locking tooth **300**. Where height **385** is 0 mm, sides **336** and **318** are the same, and top portion **340** intersects with base portion **310**. The dimensions and axes described in FIGS. 3A through 3B are applicable to both rigid locking tooth **300** and rigid locking tooth **305**.

Sides **320** and **330** have a facing relationship, wherein height **320** is greater than height **330**. In certain embodiments wherein height **385** is greater than 0, the ratio of height **375** to height **385** is between about 2:1 to about 6:1.

Top **340** comprises a rectangular shape, and is defined by sides **324**, **342**, **336**, and **344**. Top **340** comprises width **382**. Referring now to FIGS. 3A and 3D, side **350** comprises a quadrilateral shape with two parallel sides **326** and **334**, and is defined by sides **312**, **326**, **334**, and **344**. Referring now to FIGS. 3A and 3E, side **360** comprises a quadrilateral shape with two parallel sides **322** and **332**, and is defined by sides **316**, **322**, **332**, and **342**.

Referring now to FIG. 3G, rigid locking tooth **300** comprises a long axis **390** comprising a first center line of base **210**, wherein that long axis **390** is parallel to long sides **312** and **316** and bisects short sides **314** and **318**. Rigid locking tooth **300** further comprises short axis **395** comprising a second center line of base **210**, wherein that short axis **395** is parallel to short sides **314** and **318** bisects long sides **312** and **316**.

FIGS. 3E and 3H illustrate Applicant's rigid locking teeth **302** and **306**.

As a general matter, individual rigid locking teeth disposed in any given plurality of rigid locking teeth **104** are arranged in a pattern of columns and rows. In various embodiments of Applicant's invention, the orientations of individual rigid locking teeth disposed in such columns and rows differ. These

6

various orientations are described herein with reference to the relationship of the long axes **390** (FIG. 3G) and short axes **395** (FIG. 3G) of adjacent rigid locking teeth in the same column, and the relationship of the long axes **390** and short axes **395** of adjacent rigid locking teeth in the same row.

References herein to axes being "aligned" mean that those axes are coaxial and/or parallel, i.e. overlap one another. Axes described herein as not being aligned are not coaxial, i.e. do not overlap. In orientations **400** (FIG. 4A) and **700** (FIG. 7A), the long axes of adjacent rigid locking teeth disposed in the same column are aligned. In orientations **500**, **600**, **800**, and **900**, the long axes of adjacent rigid locking teeth disposed in the same column are not aligned. In orientations **400**, **500**, **700**, and **800**, the long axes of adjacent rigid locking teeth disposed in the same row are parallel. In orientations **600** and **900**, the long axes of adjacent rigid locking teeth disposed in the same row are not parallel.

In orientations **400**, the short axes of adjacent rigid locking teeth disposed in the same row are aligned. In orientations **500**, **600**, **700**, **800**, and **900**, the short axes of adjacent rigid locking teeth disposed in the same row are not aligned.

FIG. 4A shows a portion of plurality of Applicant's rigid locking teeth, such as plurality of rigid locking teeth **104**, wherein that plurality of rigid locking teeth comprise orientation **400**. In certain embodiments, each of the plurality of rigid locking teeth shown in FIG. 4A comprises a rigid locking tooth **300**. In certain embodiments, each of the plurality of rigid locking teeth shown in FIG. 4A comprises a rigid locking tooth **302**. In certain embodiments, each of the plurality of rigid locking teeth shown in FIG. 4A comprises a rigid locking tooth **304**. In certain embodiments, each of the plurality of rigid locking teeth shown in FIG. 4A comprises a rigid locking tooth **306**. In certain embodiments, each of the plurality of rigid locking teeth shown in FIG. 4A is selected from the group consisting of a rigid locking tooth **300**, a rigid locking tooth **302**, a rigid locking tooth **304**, and a rigid locking tooth **306**.

In the illustrated embodiment of FIG. 4A, the plurality of rigid locking teeth are arranged in columns and rows, namely columns **1**, **2**, **3**, and **4**, and rows **1**, **2**, **3**, and **4**. In the illustrated embodiment of FIG. 4A, rigid locking tooth **1,1** for example is disposed in column **1** and row **1**. For the sake of clarity, FIG. 4A shows a total of 16 rigid locking teeth. In actual implementation, Applicant's plurality of rigid locking teeth **104** comprises between about one hundred, and about ten thousand individual rigid locking teeth, per square inch.

FIGS. 4B and 4C comprise top views of orientation **400** shown in FIG. 4A. Referring now to FIG. 4B, the rigid locking teeth comprising column **1** are separated from the rigid locking teeth comprising column **2** by a spacing **402**. In certain embodiments, spacing **402** is substantially the same as the width **382** (FIG. 3F) of the individual rigid locking teeth. By "substantially the same," Applicant means within plus or minus ten percent (10%). In other embodiments, spacing **402** is less than width **382**. In still other embodiments, spacing **402** is greater than width **382**.

Similarly, column **2** and **3** are separated by spacing **404**, and column **3** and column **4** are separated by spacing **406**. In certain embodiments, spacing **404** is substantially the same as the width **382** (FIG. 3F) of the individual rigid locking teeth. In other embodiments, spacing **404** is less than width **382**. In still other embodiments, spacing **404** is greater than width **382**. In certain embodiments, spacing **406** is substantially the same as the width **382** (FIG. 3F) of the individual rigid locking teeth. In other embodiments, spacing **406** is less than width **382**. In still other embodiments, spacing **406** is greater than width **382**.

In orientation **400** shown in FIGS. **4A**, **4B**, and **4C**, the long axes **390** of each rigid locking tooth disposed in a column are aligned, and the short axis **395** of each rigid locking tooth disposed in a row are aligned. For example, rigid locking teeth **1,1**; **1,2**; **1,3**; and **1,4**; are each disposed in column **1**. Aggregate long axis **450** comprises the individual long axis **390** of each of rigid locking teeth **1,1**; **1,2**; **1,3**; and **1,4**. Similarly, aggregate long axes **460**, **470**, and **480**, comprise the individual long axis **390** of each rigid locking tooth disposed in columns **2**, **3**, and **4**, respectively.

Rigid locking teeth **1,1**; **2,1**; **3,1**; and **4,1**; are disposed in row **1**. Aggregate short axis **410** comprises the individual short axis **395** of each of rigid locking teeth **1,1**; **2,1**; **3,1**; and **4,1**. Similarly, aggregate short axes **420**, **430**, and **440**, comprise the individual short axis **395** of each tooth disposed in rows **2**, **3**, and **4**, respectively.

FIG. **5A** shows a portion of plurality of Applicant's rigid locking teeth, wherein that plurality of rigid locking teeth comprise orientation **500**. In certain embodiments, each of the plurality of rigid locking teeth shown in FIG. **5A** comprises a rigid locking tooth **300**. In certain embodiments, each of the plurality of rigid locking teeth shown in FIG. **5A** comprises a rigid locking tooth **302**. In certain embodiments, each of the plurality of rigid locking teeth shown in FIG. **5A** comprises a rigid locking tooth **304**. In certain embodiments, each of the plurality of rigid locking teeth shown in FIG. **5A** comprises a rigid locking tooth **306**. In certain embodiments, each of the plurality of rigid locking teeth shown in FIG. **5A** is selected from the group consisting of a rigid locking tooth **300**, a rigid locking tooth **302**, a rigid locking tooth **304**, and a rigid locking tooth **306**.

In the illustrated embodiment of FIG. **5A**, the plurality of rigid locking teeth are arranged in columns and rows, namely columns **1**, **2**, **3**, and **4**, and rows **1**, **2**, **3**, and **4**. In the illustrated embodiment of FIG. **5A**, rigid locking tooth **1,1** for example is disposed in column **1** and row **1**. For the sake of clarity, FIG. **5A** shows a total of 16 rigid locking teeth.

The rigid locking teeth comprising column **1** are separated from the rigid locking teeth comprising column **2** by a spacing **502**. In certain embodiments, spacing **502** is substantially the same as the width **382** (FIG. **3F**) of the individual rigid locking teeth. By "substantially the same," Applicant means within plus or minus ten percent (10%). In other embodiments, spacing **502** is less than width **382**. In still other embodiments, spacing **502** is greater than width **382**.

Similarly, column **2** and **3** are separated by spacing **504**, and column **3** and column **4** are separated by spacing **506**. In certain embodiments, spacing **504** is substantially the same as the width **382** (FIG. **3F**) of the individual rigid locking teeth. In other embodiments, spacing **504** is less than width **382**. In still other embodiments, spacing **504** is greater than width **382**. In certain embodiments, spacing **506** is substantially the same as the width **382** (FIG. **3F**) of the individual rigid locking teeth. In other embodiments, spacing **506** is less than width **382**. In still other embodiments, spacing **506** is greater than width **382**.

FIG. **5B** comprise a top view of one column of rigid locking teeth disposed in orientation **500**. In orientation **500**, the individual long axes **390** of each rigid locking tooth disposed in a column are not aligned. For example, rigid locking tooth **1,1** comprises long axis **515**, and the adjacent rigid locking tooth in column **1**, namely rigid locking tooth **1,2**, comprises long axis **525**. As Ms. **5B** and **5C** illustrate, long axes **515** and **525** are not aligned. Rather, long axis **525** is offset from long axis **515** by a first offset angle $\Phi 1$. In certain embodiments, first offset angle $\Phi 1$ is between about 5 degrees and about 45 degrees.

Similarly, long axis **535** is offset from long axis **525** by a second offset angle. In certain embodiments, second offset angle is between about 5 degrees and about 45 degrees. Long axis **545** is offset from long axis **535** by a third offset angle. In certain embodiments, the third offset angle is between about 5 degrees and about 45 degrees. As a general matter, in orientation **500** the long axis for the (i)th rigid locking tooth in (j)th column is offset from the long axis of the adjacent (i+1)th rigid locking tooth in that (j)th column by the (i)th offset angle.

In orientation **500** illustrated in FIGS. **5A** and **5D**, the long axes **390** of adjacent rigid locking teeth disposed in the same column are not aligned, however the long axes of the rigid locking teeth in the same row are parallel. Rigid locking teeth **1,4**; **2,4**; **3,4**; and **4,4**, are all disposed in row **4**, and comprise long axes **510**, **520**, **530**, and **540**, respectively. As illustrated in FIG. **5D**, long axes **510**, **520**, **530**, and **540**, are parallel.

FIG. **6A** shows a portion of Applicant's plurality of rigid locking teeth, wherein that plurality of rigid locking teeth comprise orientation **600**. In certain embodiments, each of the plurality of rigid locking teeth shown in FIG. **6A** comprises a rigid locking tooth **300**. In certain embodiments, each of the plurality of rigid locking teeth shown in FIG. **6A** comprises a rigid locking tooth **302**. In certain embodiments, each of the plurality of rigid locking teeth shown in FIG. **6A** comprises a rigid locking tooth **304**. In certain embodiments, each of the plurality of rigid locking teeth shown in FIG. **6A** comprises a rigid locking tooth **306**. In certain embodiments, each of the plurality of rigid locking teeth shown in FIG. **6A** is selected from the group consisting of a rigid locking tooth **300**, a rigid locking tooth **302**, a rigid locking tooth **304**, and a rigid locking tooth **306**.

In the illustrated embodiment of FIG. **6A**, the plurality of rigid locking teeth are arranged in columns and rows, namely columns **1**, **2**, **3**, and **4**, and rows **1**, **3**, and **4**. In the illustrated embodiment of FIG. **6A**, rigid locking tooth **1,1** for example is disposed in column **1** and row **1**. For the sake of clarity, FIG. **6A** shows a total of 16 rigid locking teeth. In actual implementation, Applicant's plurality of rigid locking teeth **104** comprises between about one hundred, and about ten thousand individual rigid locking teeth.

The rigid locking teeth comprising column **1** are separated from the rigid locking teeth comprising column **2** by a maximum spacing **602**. In certain embodiments, maximum spacing **602** is substantially the same as the width **382** (FIG. **3F**) of the individual rigid locking teeth. By "substantially the same," Applicant means within plus or minus twenty percent (20%). In other embodiments, maximum spacing **602** is less than width **382**. In still other embodiments, maximum spacing **602** is greater than width **382**.

Similarly, column **2** and **3** are separated by spacing maximum **604**, and column **3** and column **4** are separated by maximum spacing **606**. In certain embodiments, maximum spacing **604** is substantially the same as the width **382** (FIG. **3F**) of the individual rigid locking teeth. In other embodiments, maximum spacing **604** is less than width **382**. In still other embodiments, maximum spacing **604** is greater than width **382**. In certain embodiments, maximum spacing **606** is substantially the same as the width **382** (FIG. **3F**) of the individual rigid locking teeth. In other embodiments, maximum spacing **606** is less than width **382**. In still other embodiments, maximum spacing **606** is greater than width **382**.

In orientation **600** illustrated in FIGS. **6A** and **6B**, the long axes **390** of adjacent rigid locking teeth disposed in the same column are not aligned. Moreover, the long axes of the rigid locking teeth in the same row are not parallel. Rigid locking teeth **1,4**; **2,4**; **3,4**; and **4,4**, are all disposed in row **4**, and

comprise long axes **610**, **620**, **630**, and **640**, respectively. As illustrated in FIG. 6B, long axes **610** is not parallel to long axis **620**, which is not parallel to long axis **630**, which is not parallel to long axis **640**.

FIG. 7A shows a portion of Applicant's plurality of rigid locking teeth, wherein that plurality of rigid locking teeth comprise orientation **700**. In certain embodiments, each of the plurality of rigid locking teeth shown in FIG. 7A comprises a rigid locking tooth **300**. In certain embodiments, each of the plurality of rigid locking teeth shown in FIG. 7A comprises a rigid locking tooth **302**. In certain embodiments, each of the plurality of rigid locking teeth shown in FIG. 7A comprises a rigid locking tooth **304**. In certain embodiments, each of the plurality of rigid locking teeth shown in FIG. 7A comprises a rigid locking tooth **306**. In certain embodiments, each of the plurality of rigid locking teeth shown in FIG. 7A is selected from the group consisting of a rigid locking tooth **300**, a rigid locking tooth **302**, a rigid locking tooth **304**, and a rigid locking tooth **306**.

In the illustrated embodiment of FIG. 7B, the plurality of rigid locking teeth comprising orientation **700** are arranged in columns and rows, namely columns **1**, **2**, **3**, and **4**, and rows **1**, **2**, **3**, and **4**. In the illustrated embodiment of FIG. 7B, rigid locking tooth **1,1** for example is disposed in column **1** and row **1**. For the sake of clarity, FIG. 7B shows a total of 16 rigid locking teeth.

The rigid locking teeth comprising column **1** are separated from the rigid locking teeth comprising column **2** by a spacing **702**. In certain embodiments, spacing **702** is substantially the same as the width **382** (FIG. 3F) of the individual rigid locking teeth. By "substantially the same," Applicant means within plus or minus ten percent (10%). In other embodiments, spacing **702** is less than width **382**. In still other embodiments, spacing **702** is greater than width **382**.

Similarly, column **2** and **3** are separated by spacing **704**, and column **3** and column **4** are separated by spacing **706**. In certain embodiments, spacing **704** is substantially the same as the width **382** (FIG. 3F) of the individual rigid locking teeth. In other embodiments, spacing **704** is less than width **382**. In still other embodiments, spacing **704** is greater than width **382**. In certain embodiments, spacing **706** is substantially the same as the width **382** (FIG. 3F) of the individual rigid locking teeth. In other embodiments, spacing **706** is less than width **382**. In still other embodiments, spacing **706** is greater than width **382**.

In orientation **700** illustrated in FIGS. 7A, 7B, and 7C, the long axes **390** of adjacent rigid locking teeth disposed in the same column are aligned. For example, aggregate long axis **710** comprises the individual long axes **390** of rigid locking teeth **1,1**; **1,2**; **1,3**; and **1,4**. Similarly, aggregate long axis **720** comprises the individual long axes **390** of rigid locking teeth **2,1**; **2,2**; **2,3**; and **2,4**. Similarly, aggregate long axis **730** comprises the individual long axes **390** of rigid locking teeth **3,1**; **3,2**; **3,3**; and **3,4**. Similarly, aggregate long axis **740** comprises the individual long axes **390** of rigid locking teeth **4,1**; **2,4**; **4,3**; and **4,4**.

In orientation **700**, the short axes **395** of the rigid locking tooth disposed in the same row are not aligned. For example, rigid locking teeth **1,1**; **2,1**; **3,1**; and **4,1**, are disposed in row **1**. Rigid locking tooth **1,4** comprises short axis **750**. Rigid locking tooth **2,4** comprises short axis **760**. Rigid locking tooth **3,4** comprises short axis **770**. Rigid locking tooth **4,4** comprises short axis **780**. In the illustrated embodiment of FIG. 7C, short axis **750** is not aligned with short axis **760**, which is not aligned with short axis **770**, which is not aligned with short axis **780**.

FIG. 8A shows a portion of plurality of Applicant's rigid locking teeth, wherein that plurality of rigid locking teeth comprise orientation **800**. In certain embodiments, each of the plurality of rigid locking teeth shown in FIG. 8A comprises a rigid locking tooth **300**. In certain embodiments, each of the plurality of rigid locking teeth shown in FIG. 8A comprises a rigid locking tooth **302**. In certain embodiments, each of the plurality of rigid locking teeth shown in FIG. 8A comprises a rigid locking tooth **304**. In certain embodiments, each of the plurality of rigid locking teeth shown in FIG. 8A comprises a rigid locking tooth **306**. In certain embodiments, each of the plurality of rigid locking teeth shown in FIG. 8A is selected from the group consisting of a rigid locking tooth **300**, a rigid locking tooth **302**, a rigid locking tooth **304**, and a rigid locking tooth **306**.

In the illustrated embodiment of FIG. 8A, the plurality of rigid locking teeth are arranged in columns and rows, namely columns **1**, **2**, **3**, and **4**, and rows **1**, **2**, **3**, and **4**. In the illustrated embodiment of FIG. 8A, rigid locking tooth **1,1** for example is disposed in column **1** and row **1**. For the sake of clarity, FIG. 8A shows a total of 16 rigid locking teeth. In actual implementation, Applicant's plurality of rigid locking teeth **104** comprises between about one hundred, and about ten thousand individual rigid locking teeth.

The rigid locking teeth comprising column **1** are separated from the rigid locking teeth comprising column **2** by a spacing **802**. In certain embodiments, spacing **802** is substantially the same as the width **382** (FIG. 3F) of the individual rigid locking teeth. By "substantially the same," Applicant means within plus or minus ten percent (10%). In other embodiments, spacing **802** is less than width **382**. In still other embodiments, spacing **802** is greater than width **382**.

Similarly, column **2** and **3** are separated by spacing **804**, and column **3** and column **4** are separated by spacing **806**. In certain embodiments, spacing **804** is substantially the same as the width **382** (FIG. 3F) of the individual rigid locking teeth. In other embodiments, spacing **804** is less than width **382**. In still other embodiments, spacing **804** is greater than width **382**. In certain embodiments, spacing **806** is substantially the same as the width **382** (FIG. 3F) of the individual rigid locking teeth. In other embodiments, spacing **806** is less than width **382**. In still other embodiments, spacing **806** is greater than width **382**.

In orientation **800** illustrated in FIGS. 8A and 8B, the long axes **390** of adjacent rigid locking teeth disposed in the same column are not aligned. For example, rigid locking teeth **1,1**; **1,2**; **1,3**; and **1,4**; comprise long axes **810**, **820**, **830**, and **840**, respectively. Long axis **810** is not aligned with long axis **820**, which is not aligned with long axis **830**, which is not aligned with long axis **840**.

In orientation **800**, the long axes of the rigid locking teeth in the same row are parallel. Rigid locking teeth **1,4**; **2,4**; **3,4**; and **4,4**, are all disposed in row **4**, and comprise long axes **840**, **880**, **890**, and **895**, respectively. As illustrated in FIG. 8B, long axes **840**, **880**, **890**, and **895**, are parallel to one another.

In orientation **800**, the short axes **395** of the rigid locking tooth disposed in the same row are not aligned. For example, the rigid locking teeth **1,1**; **2,1**; **3,1**; and **4,1**; comprise short axes **815**, **850**, **860**, and **870**, respectively, wherein axis **815** is not aligned with axis **850**, which is not aligned with axis **860**, which is not aligned with axis **870**.

FIG. 9A shows a portion of plurality of Applicant's rigid locking teeth, wherein that plurality of rigid locking teeth comprise orientation **900**. In certain embodiments, each of the plurality of rigid locking teeth shown in FIG. 9A comprises a rigid locking tooth **300**. In certain embodiments, each of the plurality of rigid locking teeth shown in FIG. 9A

11

comprises a rigid locking tooth **302**. In certain embodiments, each of the plurality of rigid locking teeth shown in FIG. **9A** comprises a rigid locking tooth **304**. In certain embodiments, each of the plurality of rigid locking teeth shown in FIG. **9A** comprises a rigid locking tooth **306**. In certain embodiments, each of the plurality of rigid locking teeth shown in FIG. **9A** is selected from the group consisting of a rigid locking tooth **300**, a rigid locking tooth **302**, a rigid locking tooth **304**, and a rigid locking tooth **306**.

In the illustrated embodiment of FIG. **9A**, the plurality of rigid locking teeth are arranged in columns and rows, namely columns **1**, **2**, **3**, and **4**, and rows **1**, **3**, and **4**. In the illustrated embodiment of FIG. **9A**, rigid locking tooth **1,1** for example is disposed in column **1** and row **1**. For the sake of clarity, FIG. **9A** shows a total of 16 rigid locking teeth. In actual implementation, Applicant's plurality of rigid locking teeth **104** comprises between about one hundred, and about ten thousand individual rigid locking teeth.

The rigid locking teeth comprising column **1** are separated from the rigid locking teeth comprising column **2** by a maximum spacing **902**. In certain embodiments, maximum spacing **902** is substantially the same as the width **382** (FIG. **3F**) of the individual rigid locking teeth. By "substantially the same," Applicant means within plus or minus ten percent (10%). In other embodiments, maximum spacing **902** is less than width **382**. In still other embodiments, maximum spacing **902** is greater than width **382**.

Similarly, column **2** and **3** are separated by spacing maximum **904**, and column **3** and column **4** are separated by maximum spacing **906**. In certain embodiments, maximum spacing **904** is substantially the same as the width **382** (FIG. **3F**) of the individual rigid locking teeth. In other embodiments, maximum spacing **904** is less than width **382**. In still other embodiments, maximum spacing **904** is greater than width **382**. In certain embodiments, maximum spacing **906** is substantially the same as the width **382** (FIG. **3F**) of the individual rigid locking teeth. In other embodiments, maximum spacing **906** is less than width **382**. In still other embodiments, maximum spacing **906** is greater than width **382**.

In orientation **900** illustrated in FIGS. **9A** and **9B**, the long axes **390** of adjacent rigid locking teeth disposed in the same column are not aligned. For example, rigid locking teeth **1,1**; **1,2**; **1,3**; and **1,4**; comprise long axes **910**, **920**, **930**, and **940**, respectively. Long axis **910** is not aligned with long axis **920**, which is not aligned with long axis **930**, which is not aligned with long axis **940**.

In orientation **900**, the long axes of the rigid locking teeth in the same row are not parallel. Rigid locking teeth **1,4**; **2,4**; **3,4**; and **4,4**, are all disposed in row **4**, and comprise long axes **940**, **980**, **990**, and **995**, respectively. As illustrated in FIG. **8B**, long axis **940** is not parallel with long axis **980**, which is not parallel with long axis **990**, which is not parallel with long axis **995**. Alternate long axes, such as long axes **940** and **990** and long axes **980** and **995**, are parallel to one another.

In orientation **900**, the short axes **395** of the rigid locking teeth disposed in the same row are not aligned. For example, the rigid locking teeth **1,1**; **2,1**; **3,1**; and **4,1**; comprise short axis **915**, **950**, **960**, and **970**, respectively, wherein axis **915** is not aligned with axis **950**, which is not aligned with axis **960**, which is not aligned with axis **970**.

While the preferred embodiments of the present invention have been illustrated in detail, it should be apparent that modifications and adaptations to those embodiments may occur to one skilled in the art without departing from the scope of the present invention as set forth herein.

12

I claim:

1. A fixturing apparatus comprising:

a base;

a housing attached to said base and formed to include a semi-circular arcuate surface in a bottom portion;

a circular member comprising a periphery and rotatably attached to said base, wherein a portion of said periphery is disposed adjacent said arcuate surface to create a channel between said housing and said circular member;

a plurality of locking teeth disposed around said periphery;

a ratchet gear attached to said circular member;

a pawl pivotably attached to said housing;

a flexible strap having a first end attached to said housing;

wherein:

when said pawl is engaged with said ratchet gear said circular member can rotate in a first direction but not in a second opposite direction;

said locking teeth permit said flexible strap to move through said channel in a first direction, but not in a second direction;

further comprising a plurality of loop-type fasteners disposed on a surface of said flexible strap.

2. The fixturing apparatus of claim **1**, further comprising a spring having a first end attached to said housing and a second end attached to said pawl.

3. The fixturing apparatus of claim **1**, wherein each locking tooth comprising said plurality of locking teeth comprises a rectangular base, a first rectangular side attached to a first end of said rectangular base and extending outwardly therefrom, and a second rectangular side attached to an opposing end of said rectangular base and extending outwardly therefrom, wherein a first rectangular side distal end is attached to a said second rectangular side distal end to form a gripping edge.

4. The fixturing apparatus of claim **3**, wherein:

said first rectangular side comprises a first surface area;

said second rectangular side comprises a second surface area;

said first surface area is less than said second surface area.

5. The fixturing apparatus of claim **3**, wherein:

said rectangular base comprises two parallel opposing short sides in combination with two parallel and opposing long sides;

each locking tooth comprises a long axis parallel to said long sides and which bisects each short side;

each locking tooth comprises a short axis parallel to said short sides and which bisects each long side;

said plurality of locking teeth are arranged in a plurality of columns and a plurality of rows.

6. The fixturing apparatus of claim **5**, wherein the long axes of each locking teeth disposed in a column are aligned with one another.

7. The fixturing apparatus of claim **5**, wherein the short axis of each locking teeth disposed in a row are aligned with one another.

8. The fixturing apparatus of claim **5**, wherein the short axis of each locking teeth disposed in a row are not aligned with one another.

9. The fixturing apparatus of claim **5**, wherein the long axes of each locking teeth disposed in a column are not aligned with one another.

10. The fixturing apparatus of claim **5**, wherein the short axis of each locking teeth disposed in a row are aligned with one another.

11. The fixturing apparatus of claim **5**, wherein the short axis of each locking teeth disposed in a row are not aligned with one another.
